

FRIDAYS AT THE UNIVERSITY

Dermatology Day

Strengthen your dermatologic assessment and management skills with a session designed for primary care providers. You'll learn to confidently diagnose and treat common skin conditions in both children and adults, while sharpening your ability to identify cancerous and precancerous lesions. The session also explores how dermatologic signs can reveal underlying systemic diseases and emphasizes early detection, evidence-based treatment, and patient education. With a focus on equity, diversity, and inclusion, you'll gain the tools to recognize how skin conditions present across different skin tones and adapt your care accordingly.

Learning Objectives

By the end of the day, the participants should be able to:

- Diagnose and manage common pediatric and adult dermatologic conditions in primary care, including chronic eczema, psoriasis, and undifferentiated skin rashes.
- Identify and differentiate dermatologic cancerous and precancerous lesions, and apply appropriate surveillance and referral strategies for skin cancer.
- Recognize dermatologic signs that may indicate underlying systemic diseases, such as Lyme disease, and integrate this knowledge into broader clinical assessment.
- Enhance clinical skills in dermatologic examination and management, with a focus on early detection, evidence-based treatment, and patient education in both acute and chronic skin conditions.
- Incorporate principles of equity, diversity, and inclusion (EDI) into dermatologic care by recognizing how skin conditions may present differently across skin tones and adapting diagnostic and treatment approaches accordingly.
